Project Proposal

Project Title:
LaboraPK: A Smart Location-Based Skilled Worker and Home Services Platform

Introduction
LaboraPK is a location-based online network that links clients with local home service providers and professional labor. In order to find and hire masons (mistris), laborers (mazdoors), electricians, plumbers, carpenters, painters and other service providers, customers now frequently need to physically visit local labor centers like Hussani Chowk. This is time consuming and provides no means of comparing employees or verifying their dependability and experience.
Customers will be able to look for employees by talent, location, availability, experience and ratings using the suggested system.
Online service requests, staff portfiles and option comparisons will all be available to customers. Employees will have the opportunity to register, change their availability, manage their profiles and accept or reject requests. User complaints, service categories and worker verification will all be handled by an administrator.
A location based worker search and clever recommendation engine that prioritizes local workers based on availability, rating, experience and distance will be the features of the system.
The local community will be the primary focus of the initial implementation, with the potential to eventually spread to other regions and create a mobile application.

Technologies
Frontend: React.js
Backend: FastAPI
Database: PostgreSQL
Authentication: JWT based secure
Location Services: Google Maps
